

Project 2 – AI Data Analysis using PartyRock

Objective

The objective of this project is to analyze user data using AI tools (PartyRock) to identify patterns, trends, and actionable insights that can improve user experience and app performance.

Methodology

Data was analyzed using the PartyRock platform. Multiple prompts were used to extract insights related to user behavior, feature usage, and trends. AI-generated outputs were reviewed and interpreted to derive meaningful conclusions.

Key Insights

- Users prefer simple and intuitive features, which increases engagement.
- Peak usage occurs at specific times, indicating user behavior patterns.
- Time-saving features are used more frequently than complex ones.
- User drop-off after initial interaction suggests a need for better onboarding.
- App performance and speed directly affect user satisfaction.

Analytics Prompt Learnings

- What patterns or trends can be observed in the data?
- At what time is user activity highest?
- Which features are most and least used?
- Where do users drop off?
- What improvements can be suggested based on the data?

Reflection

The AI analysis was mostly accurate and helpful in identifying trends and patterns. However, some outputs required manual validation, as the AI lacked full context and occasionally generalized results.

Conclusion

This project demonstrated how AI tools like PartyRock can simplify data analysis and provide quick insights. With proper prompts and human validation, AI can be a powerful tool for decision-making and improving user experience.
